The Mechatronic Engineering stream provides the student with the ability to acquire a hybrid range of skills based on mechanics, electronics and computing. Whilst there is a comprehensive coverage of mechanical engineering and design areas, the stream enables a deeper understanding of the principles supporting the conception, design, construction, maintenance, integration and repair of intelligent machines. Typical examples of these machines are robots, white goods, cameras, automated test equipment and transport vehicles.

Typical fields which may be encompassed by the program include building services, computer controlled plant, manufacturing, robotics and autonomous vehicles. An emphasis is placed on the application of engineering science, development and management in these fields.
